

PRESS RELEASE

KOFENOT™. It Took a Village

Kill a Laptop. Kill a Car. Start a Company

One Dead Laptop. One Dead Car. One-way ticket to Silicon Valley.

A cup of coffee on a snowy afternoon at Palisades Tahoe ended the short life of ski instructor Lena Faber's new MacBook Pro.

That lunchtime, she was building a space-time cube of human history. Because once she was a **journalist**.

After this spill drama, she started putting an upside-down coffee cup under the hinge of her new laptop to deflect future spills. She wanted to stay out of the repair statistics showing that spilled drinks **kill millions of laptops** every year.

One stormy noon, she miraculously escaped a highway crash and pulled onto the shoulder to catch her breath. The next second, an elderly driver slammed into her car from the side, sending it down a steep hill. She floored the accelerator and held the steering wheel dead straight, fighting to keep the car from rolling over. Just before reaching the bottom, she hit the brakes hard, instantly lifted off the accelerator to keep

the front bumper from digging into the ground, then braked gently as the car slid into the muddy field. The car died. She walked away uninjured. Because once she was a **car racer**.

That same day, she bought another car. The next day, she moved to Silicon Valley to turn her **space-time cube** into a BI startup.

Folding Cars and Flying Wedge

Her upside-down eureka started attracting attention, so she sketched a wedge, filed a utility patent, and 3D printed an ugly prototype.

One engineer watching her struggle to **beautify** a piece of plastic offered help. Lena raised the bar: the thing had to not just close -it had to snap. Loud. The engineer laughed and drew it for manufacturing.

Before then, it took countless 3D prints to figure out the precise geometry of the opening and closing mechanism with no pins, no magnets, and no adhesives either. 1 oz. Sharp. Oh, **and snap!**

She didn't know yet that the person patiently helping her was one of the Valley's most senior industrial engineers in charge of designing flying cars...

Done. People stare at KOFENOT™ as if it were a **Rubik's Cube**, turn it around in their hands, open and close it a few times, and then ask the same question: "How does this thing work?" Including engineers!

That was the first hint that the invention wasn't quite as simple as it looks.

Silicon Valley, Unfiltered

Then came manufacturing... Felt like online gambling. Hours of video calls with a girl from a massive Chinese factory, accustomed to handling far larger orders yet explaining to Lena all the nuts and bolts of manufacturing. Shipping at times when no one guaranteed the product would arrive at all. Disclaimer: it did.

Meanwhile, Lena was still a few thousand dollars short of paying a balance to the factory. She mentioned the situation to her new friends in her new Los Gatos neighborhood. The next minute her phone dinged - a few thousands dollars dropped to her Zelle... No question asked. No paper signed. Just people who believed she would figure it out.

More obstacles later, and during a regular phone call from a friend she'd known since hiking the Appalachian Trail realized she still needed more money. And the next minute

the same ding. No question asked. No paper signed. Just trust accumulated over thousands of miles of trail.

Then packaging became the bottleneck. The owner of a huge Santa Clara printing facility looked at the KOFENOT™, punched two holes in the piece of hard paper: “you figure out the rest; I’ll print a bunch.” No money asked, no paper signed...
A friend storing her inventory in his garage. A friend storing more inventory in his office.

KOFENOT™ may have one inventor. But it has many fingerprints. It feels like something an entire Silicon Valley neighborhood quietly decided should exist.

About KOFENOT™

KOFENOT™ is a 1 oz, flat-folding laptop wedge that lifts a laptop at the hinge to improve posture while helping deflect spills away from the keyboard. It also serves as a stand for phones and tablets and features a front-facing area for custom branding, making it suitable for corporate gifts, conferences, trade shows, and promotional campaigns.
